Notes from opening presentation:

Acknowledges land

Sponsors of Code the Change:

- Clio
- Aws
- Voltex
- Pason
- Benevity

Nov. 7, 2026

- 12pm - Lunch
- 6pm - dinner

Nov. 8, 2026

- Judging

Sponsored resources (able to use in project):

- Arduio
- Aws
- n8n.io credits
- Keenable.ai credits
- Open data canada (goverment of canada)
- Google healthcare api

Side pots:

- Best local impact
- Clio best accessibility

Prompts (pick one topic to develop for the hackathon):

- Prompt 1:
    - How can we leverage technology to promote health, social connection, and well-being in our communities?
- Prompt 2:
    - How can we leverage technology to help people develop in-demand skills and build meaningful networks in a rapidly changing job market?
- Participants are encouraged to think creatively and develop solutions that address at least one of these critical issues.

Judging criteria:

Category	Discription
Innovation & creativity	Is the idea original or a fresh take on existing solutions? Does it creatively apply technology to urban challenges (e.g., housing, mobility, disaster resilience, inclusivity)
Impact & relevance to prompt	Does the solution clearly address the challenge? Could it meaningfully improve lives?
feasibility	Is the solution practical given real constraints (buget, infrastructure, etc.)? Could it scale beyond a demo into a real city/community setting?
Technical execution	Quality of the implementation (working prototype, technical depth, stability)? Use of appropriate technology stack. Is the solution technically sound and well-built?
User experience & design	Is the solution intuitive, accessible, and user friendly? Is the solution aesthetically pleasing? Does the design of the product elevate its function and original idea?

Sidepot criteria (not main):

Category	Discription
Best local impact - benevity	Recognizes projects that address real-worls challenges within the Calgary community, demonstrating the potential to create meaningful, positive, and lasting change
Best in Accesibiloty - Clio	Assess how effectively the project promotes accessibility, inclusivity, and user trust. Consider whether the solution is easy to use and accessibible to a diverse range of users, how it protects user privacy and data, and whether it demonstrates transperrnecy and responsible design.
Best use of real-world energy - voltex solutions	Recognizes projects that use real energy data to create meaningful benefits for people and communities. Projects must use published or measured energy data, such as AESO market and system reports. Historical data is accessptted, live data is encouraged, Made-up, sample, or AI-generated

	does not qualify.

Accessibility

- Speech

Safety

- Face or id verification
-

Ideas

- Calgary flames events, homeless shelter events, running events etc
- People can have “travel mode” on their profile

Prompt

Plan out a website we will call this Tnadem (with a bike logo with two people with smiley faces) the reason for this name is tandem does not prompt individsuality but group uniformitywhere people can connect (for our prototype, specifically Calgary or people travelling to calgary) where people can connect, this is not a social network, rather it is a website to foster connections between groups of people with many interests (i.e. running club, reading club, gym culture, bands, movie watching clubs,) each profile will be verified by government issued ID or passport, account creation should work like early facebook, and allow users to choose preference, interests, location, should they disclose info about themselves (i.e. health/mental), the application will have the events a user can create itha slide bar for event costs and functions similar to that (i.e. filtering events),on each profile users can link their socials like insta, strava, discord, alltrails , letterbox etc, each user will; have a credit score based on how many events they have attended (no people judged), but event can be judged by people, people can schedule events (i.e. for people travelling so they dont have to contact agencies to set this up and connect with local calgarians), because this is a hackathon we want tp use local chrome storage or other options that are free and easy to implement, for this each event should have a group chat and events are ranked on numerous criteria and but on a calgary based leaderboard which can be filtered by type of event, in the ui add a button to open the map of calgary with events that are registered shown on the map, make the map interactive with event info and split by city quadrant, make red and white theme kinda like a calgary stampedish theme, also we want it to be accessible to some group of people (ill leave it to you claude)

TNadem — Build a Hackathon-Winning Community Connection Platform

1. Your Role and Mission

You are an elite full-stack software engineer, UI/UX designer, product strategist, and hackathon mentor.

Your task is to **design and implement a complete, functional, visually exceptional web application called TNadem**, a Calgary-first platform that helps people form meaningful real-world connections through shared interests, group activities, and community events.

This is a hackathon project, not a conceptual design exercise. Build an actual working prototype with functional interactions, persistent data, responsive layouts, and a compelling live demonstration.

Prioritize these judging criteria:

1. **Innovation & Creativity:** Deliver an original approach to urban connection and community participation.
2. **Impact & Relevance:** Address a meaningful Calgary urban challenge with measurable potential benefits.
3. **Feasibility:** Build something practical, affordable, and capable of scaling beyond the prototype.
4. **Technical Execution:** Demonstrate a functional, technically sound application with a coherent architecture.
5. **User Experience & Design:** Deliver an intuitive, accessible, polished, and memorable interface.

We also want to compete for:

- Best Local Impact (Benevity)
- Best in Accessibility (Clio)

Do not sacrifice functionality for unnecessary complexity. We need a prototype that judges can actually use.

---

2. Product Identity and Philosophy

Name: TNadem

Inspired by the word **tandem**, meaning people moving together toward a shared destination.

The deliberate name TNadem represents the idea that meaningful community is created through participation, cooperation, and shared experiences.

Our Philosophy

"Better Together. Calgary Connected."

Most social platforms emphasize individual profiles, popularity, followers, and online engagement.

TNadem reverses this model.

Instead of asking:

"Who should I follow?"

TNadem asks:

"What can we do together?"

We are not building another social network.

We are building a platform that helps people discover communities, participate in real-world activities, and develop meaningful connections.

The group and the activity are the central elements, not the individual.

The Problem

People living in or visiting Calgary often face barriers to community participation:

- New residents struggle to find welcoming communities.
- Travellers want authentic experiences with locals instead of expensive organized tours.
- People with niche interests have difficulty finding others who share them.
- Existing events are fragmented across Instagram, Discord, Facebook, Strava, Meetup, and other platforms.
- Some people experience social anxiety or uncertainty about joining unfamiliar groups.
- Accessibility information about events is often incomplete or unavailable.
- Many activities appear expensive or intimidating to first-time participants.

Our Solution

TNadem creates one centralized platform where Calgary residents and visitors can discover, organize, and participate in interest-based activities.

Our core value proposition:

"Find your people through the things you love doing."

---

3. Branding and Visual Identity

Create an original, modern brand inspired by Calgary's identity and the Calgary Stampede.

Logo

Design a distinctive, memorable TNadem logo featuring:

- A tandem bicycle with two riders.
- Both riders have simple, friendly smiley faces.
- A clean, recognizable silhouette.
- A sense of movement, cooperation, and shared direction.
- A minimalist vector-inspired aesthetic.
- A version suitable for the navigation bar, favicon, and splash screen.

Avoid overly detailed illustrations or childish-looking artwork.

The logo should communicate warmth, community, and collaboration while remaining professionally designed.

Colour Palette

Use a Calgary-inspired red and white identity.

Primary colours:

- Stampede Red: `#C8102E`
- Deep Red: `#9B1026`
- Warm White: `#FAFAF8`
- Pure White: `#FFFFFF`
- Charcoal: `#202124`
- Light Grey: `#F3F4F6`

Use red strategically for primary buttons, selected filters, active navigation, event highlights, and important actions.

Do not make the entire website red.

Use a clean white foundation, charcoal typography, subtle grey borders, and generous whitespace.

The overall aesthetic should feel like a modern, well-funded technology startup, not a generic hackathon dashboard.

Design Inspiration

Combine:

- Airbnb's intuitive discovery experience.
- Strava's community and activity identity.
- Eventbrite's event organization capabilities.
- Linear's polished interface and interaction quality.
- Calgary's local visual identity.

Do not copy these products.

Create a distinct TNadem design language.

Design Requirements

- Beautiful typography, preferably Inter or a similarly modern font.
- Responsive layouts.
- Smooth, restrained animations.
- Elegant event cards.
- High-quality icons.
- Consistent border radii.
- Clear visual hierarchy.
- Thoughtful hover and focus states.
- Skeleton loading states where appropriate.
- Empty states with helpful calls to action.
- Accessible colour contrast.
- A polished desktop experience and excellent mobile usability.

Avoid generic AI-generated gradients, excessive shadows, unnecessary glassmorphism, and cluttered interfaces.

---

4. Core Innovation: Group-First Social Discovery

TNadem should not feel like a traditional social media platform.

There should be:

- No follower counts.
- No popularity rankings for individuals.
- No public personal ratings.
- No endless social feeds.
- No competition for attention.

Instead, users connect through shared activities.

The main discovery experience should prioritize:

1. Interests.
2. Events.
3. Community groups.
4. Location.
5. Accessibility.
6. Affordability.
7. Availability.

The goal is to move users from online discovery to real-world participation as efficiently as possible.

Signature Product Principle

"Less scrolling. More doing."

Design the interface around this principle.

---

5. User Registration and Onboarding

Create a polished, multi-step onboarding experience inspired by early Facebook's straightforward registration process.

The process should be simple, welcoming, and personalized.

Step 1: Account Creation

Collect:

- First name.
- Last name.
- Email address.

- Password.
- Age eligibility confirmation.
- Calgary resident or visitor status.

Support demo registration and login.

Step 2: Location

Ask:

"Where will you be exploring?"

Allow:

- Calgary resident.
- New to Calgary.
- Visiting Calgary.
- Planning a future visit.

For Calgary users, allow selection of:

- Northwest (NW)
- Northeast (NE)
- Southwest (SW)
- Southeast (SE)

Users may optionally choose a more specific neighbourhood.

Never require a precise home address.

For travellers, collect optional arrival and departure dates.

Step 3: Interests

Present a beautiful interactive interest-selection interface.

Suggested categories:

- Running and athletics.
- Gym and fitness.
- Cycling.
- Hiking and outdoor adventures.
- Reading and literature.
- Movies and cinema.
- Music and bands.

- Art and creativity.
- Technology and programming.
- Board games and gaming.
- Food and coffee.
- Volunteering.
- Photography.
- Language exchange.
- Cultural experiences.
- Study groups.
- Recreational sports.

Allow multiple selections.

Use these preferences to personalize event discovery.

Step 4: Social Connections

Users may optionally link external profiles:

- Instagram.
- Strava.
- Discord.
- AllTrails.
- Letterboxd.
- Spotify.
- GitHub.
- Personal website.

For the prototype, allow users to add and validate profile URLs.

Do not attempt to implement unnecessary OAuth integrations unless time permits.

Step 5: Privacy and Personal Preferences

Allow users to decide which information appears publicly.

Offer controls for:

- Profile visibility.
- Display name.
- Approximate location.
- Interests.
- Social links.
- Event attendance history.

- Accessibility preferences.
- Optional personal disclosures.

Users may optionally share information relevant to their event experience, such as:

- Preference for smaller groups.
- Preference for quieter environments.
- Mobility accessibility requirements.
- Sensory accessibility requirements.
- Dietary considerations.
- Comfort with beginner-friendly events.

Important: Do not require users to disclose diagnoses, mental health conditions, disabilities, or sensitive medical information.

Use practical participation preferences rather than medical labels wherever possible.

Private accessibility preferences should not automatically appear on public profiles.

---

6. Identity Verification and Community Trust

TNadem should promote trust without creating a judgment-based social hierarchy.

Long-Term Vision

Users can verify their identity using a government-issued ID or passport through a reputable third-party identity verification provider.

A successfully verified account receives a verification badge.

Hackathon Implementation

Do not collect, upload, or store real government IDs or passport images.

Instead, implement a clearly labelled **simulated verification flow** for demonstration purposes.

Create realistic states:

- Not verified.
- Verification pending.
- Demo verified.

Explain that production verification would require a secure third-party provider and appropriate privacy protections.

The demo badge must not falsely imply that a real identity check occurred.

Trust Philosophy

Verification establishes that an account has completed a trust process.

It does not establish that a person is morally better, more reliable, or more valuable than another person.

Do not implement public person-to-person ratings.

---

7. Community Participation Score

Implement a unique participation system called:

TNadem Miles

This replaces the concept of a traditional credit score.

Users earn TNadem Miles through participation in community activities.

Example demo rules:

- Attend a confirmed event: +10 miles.
- Host a completed event: +15 miles.
- Participate in a new interest category: +5 miles.
- Join a community volunteer activity: +10 miles.

Prevent repeated check-ins from generating unlimited points.

Miles represent participation, not social status, personal worth, or trustworthiness.

Profile Display

Show:

- Total TNadem Miles.
- Events attended.
- Events hosted.
- Interest categories explored.
- Community participation milestones.

Example milestones:

- First Ride: Attended first event.
- Calgary Explorer: Participated in four event categories.
- Community Builder: Hosted three events.
- Helping Hand: Participated in a volunteer event.

Do not rank individual users publicly.

This system should encourage participation without creating unhealthy competition.

---

8. Event Discovery — Main Application Experience

The event discovery page is one of the most important parts of the application.

Make it exceptional.

Event Categories

Users should be able to discover:

- Running clubs.
- Reading clubs.
- Gym meetups.
- Hiking groups.
- Cycling events.
- Movie nights.
- Local bands and jam sessions.
- Board game nights.
- Coffee meetups.
- Volunteer opportunities.
- Technology meetups.
- Photography walks.
- Recreational sports.
- Cultural experiences.
- Traveller and local meetups.

Event Cards

Each event card should display:

- Event title.
- Attractive event image or category illustration.
- Date and time.
- Calgary location and quadrant.
- Price.
- Interest category.
- Number of registered participants.
- Maximum capacity.
- Accessibility features.
- Beginner-friendly indicator.
- Host name and demo verification status.
- Event rating, where sufficient feedback exists.

Add a prominent **Join Event** button.

Joining an event must actually update the application's state.

Filtering System

Implement a functional filtering sidebar or panel.

Filters should include:

Price Slider

An interactive slider allowing users to set a maximum event cost.

Example: $0–150+$.

Include a Free Only toggle.

Category

Allow multi-select category filters.

Calgary Quadrant

- NW
- NE
- SW
- SE
- All Calgary

Date

- Today.
- Tomorrow.
- This weekend.
- Next seven days.
- Custom date range.

Event Size

- Small groups.
- Medium groups.
- Large groups.

Accessibility

- Wheelchair accessible.
- Step-free access.
- Accessible washrooms.
- Quiet environment.
- Sensory-friendly.
- Virtual participation available.
- Beginner-friendly.

Other Filters

- Available spaces.
- Verified demo host.
- Traveller-friendly.
- Free activities.
- Indoor/outdoor.

Filters must work together and update results immediately.

Include a clear reset-filters button.

Sorting

Allow users to sort by:

- Recommended.
- Soonest.
- Lowest price.
- Highest event rating.

- Closest to selected area.
- Most popular.
- Newest.

Recommendation logic should prioritize shared interests, accessibility preferences, availability, and relevant location.

Avoid recommending inaccessible events as a user's best match when they have explicitly specified accessibility needs.

---

9. Interactive Calgary Event Map

This is a major demonstration feature.

Add a highly visible button:

"Explore Calgary Map"

The button opens an interactive map displaying registered events throughout Calgary.

Map Requirements

Use Leaflet with OpenStreetMap tiles if practical.

Display actual Calgary geography.

Include:

- Calgary city centre.
- Major roads.
- Bow River.
- Neighbourhood context.
- Event markers.
- Quadrant boundaries or clearly labelled quadrant regions.

Do not use a static map image.

Interactive Features

- Click an event marker to open an event preview.
- Show title, category, date, price, and available spaces.

- Allow joining or opening the event detail page.
- Filter markers by event category.
- Filter by price.
- Filter by date.
- Filter by accessibility.
- Filter by Calgary quadrant.
- Toggle between map and list views.
- Fit map bounds to visible events.
- Use marker clustering if needed.

Use different marker icons or visual treatments for event categories.

Avoid relying on colour alone to communicate categories.

Map-to-List Synchronization

Filtering events on the map should produce the same results as filtering in the list.

Use shared filtering logic rather than separate implementations.

Calgary-Specific Experience

Seed realistic events in recognizable Calgary areas such as:

- Prince's Island Park.
- University of Calgary.
- Kensington.
- Inglewood.
- Bowness Park.
- Fish Creek Provincial Park.
- Calgary Central Library.
- Olympic Plaza area.
- Nose Hill Park.

Use accurate public venue coordinates where possible.

Do not invent exact street addresses.

For demo events, clearly distinguish fictional event listings from actual public events.

---

10. Event Creation and Hosting

Users should be able to create their own events through a polished multi-step form.

Event Creation Fields

- Event title.
- Description.
- Category.
- Event image or category illustration.
- Date.
- Start time.
- End time.
- Location.
- Calgary quadrant.
- Cost.
- Maximum participants.
- Minimum participants, if applicable.
- Beginner-friendly status.
- Accessibility information.
- Required equipment.
- Event guidelines.
- Traveller-friendly status.
- Public or private visibility.

Functional Requirements

When an event is created:

1. Validate required information.
2. Save the event.
3. Add it to the discovery page.
4. Add its marker to the Calgary map.
5. Create its associated group chat.
6. Display it in the host's dashboard.
7. Make it available for joining.

The user should be able to edit or cancel their own event.

Prevent invalid dates, negative prices, and attendance exceeding capacity.

For the demo, include a few sample events that the user can edit.

---

11. Event Group Chats

Every event should have a dedicated group chat.

The group chat becomes available to users who have joined that event.

Features

- Send messages.
- Display sender name.
- Show timestamps.
- Display event details in a sidebar or header.
- Show participant list.
- Display host announcements.
- Allow users to leave the event.
- Persist messages across refreshes.

For the hackathon prototype, local persistent chat is sufficient if the app clearly labels it as a single-browser demo.

If using a free real-time backend is practical, implement live chat between browser sessions.

Do not display fake real-time messages as though they came from actual users.

Seeded demonstration messages should be clearly identifiable as demo content.

Safety

Provide a basic report-event and report-message interface.

Do not implement an unmoderated public messaging directory.

---

12. Traveller-to-Local Connections

This should be one of TNadem's strongest differentiators.

Create a dedicated experience called:

"Explore Like a Local"

Travellers visiting Calgary can discover activities hosted by local residents.

Instead of paying an agency to organize every experience, travellers can find community-hosted activities aligned with their interests.

Example:

A visitor arriving in Calgary for three days selects:

- Visiting November 12–15.
- Interested in hiking, coffee, and photography.
- Budget: $40.
- Prefers beginner-friendly activities.

TNadem displays matching events during their visit.

Traveller Features

- Enter travel dates.
- Select interests.
- Choose budget.
- Select preferred quadrants.
- Discover traveller-friendly events.
- Join activities before arriving.
- Access event group chats.
- View event locations on the Calgary map.

Suggested Feature: Calgary Weekend Planner

Generate a simple personalized event itinerary based on existing TNadem events.

Example:

Saturday:

- 9:00 AM: Community running group.
- 1:00 PM: Photography walk.

Sunday:

- 10:00 AM: Local book and coffee meetup.

Only suggest events that actually exist in the application's dataset.

Respect event capacity, dates, and user preferences.

This does not need an external AI API.

Implement a transparent rule-based recommendation engine.

---

13. Community Groups

Allow users to discover and join persistent interest-based groups.

Examples:

- Calgary Sunrise Runners.
- Kensington Book Club.
- YYC Film Society.
- Calgary Weekend Hikers.
- Beginner Gym Community.
- Calgary Student Developers.
- YYC Jam Sessions.

Each group should have:

- Group name.
- Description.
- Category.
- Cover image.
- Member count.
- Upcoming events.
- Organizer.
- Join Group button.
- Group guidelines.

Groups should exist independently from individual events.

One group can host multiple events over time.

A user may join multiple groups.

Do not create individual popularity metrics.

---

14. Event Ratings and Calgary Leaderboard

TNadem should allow events to be evaluated without rating individual people.

Post-Event Feedback

After attending an event, users may provide:

- Overall event rating (1–5 stars).
- Organization rating.
- Accuracy of event description.
- Accessibility information accuracy.
- Optional written feedback.

Only confirmed attendees can submit event reviews.

One review per attendee per event.

Do not allow users to rate other attendees personally.

Calgary Event Leaderboard

Create a dedicated leaderboard displaying highly rated events and community activities.

Allow filtering by:

- Event category.
- Calgary quadrant.
- Date range.
- Free or paid.
- Accessibility features.

Display:

- Event name.
- Category.
- Average rating.
- Number of reviews.
- Attendance.
- Community engagement.

Fair Ranking

Avoid ranking purely by attendance or total reviews, which would unfairly favour large events.

Use a simple transparent ranking formula combining:

- Bayesian-adjusted event rating.
- Participation relative to capacity.

- Event completion.
- Review confidence.

Show a short explanation of how rankings work.

Events with insufficient feedback should be labelled "New" rather than artificially ranked as the best.

Important: Rank events, not individuals.

---

15. Accessibility — A Major Competitive Advantage

Accessibility must be a foundational feature, not an afterthought.

Design TNadem to be welcoming to people with different physical, sensory, cognitive, and social participation needs.

Target WCAG 2.2 AA where practical.

Technical Accessibility

Implement:

- Semantic HTML.
- Keyboard navigation.
- Visible keyboard focus indicators.
- Screen-reader labels.
- Accessible form validation.
- Sufficient colour contrast.
- Alt text.
- Reduced-motion support.
- Responsive text scaling.
- Clear error messages.
- No colour-only information.
- Accessible modal dialogs.
- Appropriate ARIA attributes.
- Skip-to-content navigation.

Community Accessibility

Introduce a feature called:

"Comfort & Access"

Users can specify event preferences without revealing private medical information.

Examples:

- Small groups preferred.
- Quiet activities.
- Beginner-friendly.
- Step-free venues.
- Wheelchair accessible.
- Accessible washrooms.
- Lower sensory stimulation.
- Free activities.
- Virtual participation.

Event Accessibility Cards

Every event should display its available accessibility information.

Distinguish between:

- Confirmed by organizer.
- Not yet confirmed.
- Not available.

Never assume a venue is accessible without information.

Signature Feature: First-Time Friendly

Allow event hosts to mark activities as welcoming to first-time participants.

Display helpful information:

- What to expect.
- What to bring.
- Whether participants need experience.
- Approximate group size.
- How to identify the group upon arrival.
- Whether participants may bring a friend.

Optional Social Comfort Mode

Create a toggle called:

"Ease Into It"

When enabled, prioritize:

- Smaller events.
- Beginner-friendly activities.
- Clear event descriptions.
- Low-pressure social settings.
- Events with detailed arrival instructions.

This should be based on user-selected preferences, not inferred mental health conditions.

The purpose is to reduce uncertainty and make community participation more approachable.

This feature should be prominently demonstrated to judges.

---

16. User Dashboard and Profiles

User Dashboard

Show:

- Personalized greeting.
- Upcoming joined events.
- Recommended activities.
- Joined groups.
- TNadem Miles.
- Saved events.
- Traveller itinerary, if applicable.
- Recently explored interests.

User Profile

Show:

- Display name.
- Optional profile photo or avatar.
- Calgary resident/visitor status.
- Approximate location, if shared.
- Interests.
- Optional social links.

- Participation milestones.
- Events attended, if public.
- Events hosted.
- Demo verification status.

Include privacy settings and profile editing.

Profiles should feel welcoming and useful, not competitive.

---

17. Landing Page

Build an exceptional landing page that immediately communicates the concept.

Hero Section

Headline:

"Find your people. Find your Calgary."

Subheading:

"From sunrise runs to late-night movie clubs, discover real experiences and meaningful connections with people who share your interests."

Primary CTA:

Explore Events

Secondary CTA:

Explore Calgary Map

Include the TNadem tandem bicycle logo.

Use an engaging visual composition that demonstrates real community activities.

Landing Page Sections

Section 1: Discover Your Community

Show beautiful cards for popular interests.

Section 2: How TNadem Works

Three steps:

1. Find your interests.
2. Join an activity.
3. Make real connections.

Section 3: Explore Calgary

Include an interactive map preview or clear CTA to the full map.

Section 4: Explore Like a Local

Highlight traveller-to-local experiences.

Section 5: Community Without Competition

Explain that TNadem focuses on shared participation rather than followers and personal ratings.

Section 6: Accessible by Design

Highlight Comfort & Access and Ease Into It.

Section 7: Featured Calgary Events

Display functional event cards linked to the discovery experience.

Finish with a strong CTA.

---

18. Navigation and Information Architecture

Create a clean, consistent navigation system.

Suggested desktop navigation:

- TNadem logo.
- Discover.
- Calgary Map.
- Groups.
- Leaderboard.
- Explore Like a Local.

- Create Event.
- Profile.

Use a prominent Create Event button.

On mobile, use a responsive menu or compact bottom navigation.

Required Pages

1. Landing page.
2. Sign up/login.
3. Onboarding.
4. Event discovery.
5. Interactive Calgary map.
6. Event details.
7. Create/edit event.
8. Event group chat.
9. Community groups.
10. User dashboard.
11. User profile.
12. Event leaderboard.
13. Traveller experience.
14. Privacy and accessibility settings.

These pages must be connected through functional navigation.

Avoid dead-end screens and placeholder buttons.

---

19. Technology Stack and Architecture

This is a time-constrained hackathon.

Use a free, modern, practical technology stack.

Preferred Stack

- React.
- TypeScript.
- Vite.
- Tailwind CSS.
- Lucide React icons.

- React Router.
- Leaflet and React Leaflet.
- OpenStreetMap.
- Browser localStorage for initial demo persistence.

Use lightweight dependencies where possible.

Do not add unnecessary frameworks.

Persistence

Phase 1: Reliable Local Prototype

Use localStorage for:

- Demo user profiles.
- Interest preferences.
- Events.
- Event registrations.
- Groups.
- Reviews.
- TNadem Miles.
- Chat messages.
- Saved events.
- User settings.

Create a clean data-access layer so localStorage can later be replaced by a backend.

Do not store passwords, government IDs, passport information, or sensitive medical information in localStorage.

For the demo, use simulated login sessions and preconfigured demo accounts. Clearly label authentication as simulated.

Phase 2: Optional Free Backend

If time permits, consider Supabase for:

- Real authentication.
- PostgreSQL database.
- Real-time group chat.
- Multi-user event registration.
- Persistent shared event data.

Only implement this if it does not jeopardize the working prototype.

The app must remain demonstrable without paid services or API keys.

Important Technical Distinction

localStorage is isolated to each browser origin and profile.

It cannot provide genuine shared events or real-time chat between separate users.

Do not pretend that localStorage alone provides a production multi-user platform.

Build a reliable single-browser demonstration first, then upgrade to shared persistence if feasible.

---

20. Data Models

Design coherent TypeScript interfaces for:

- User.
- Interest.
- CommunityGroup.
- Event.
- EventRegistration.
- EventReview.
- GroupMembership.
- ChatMessage.
- ParticipationMilestone.
- AccessibilityPreferences.
- TravellerPreferences.

Each event should have a unique ID and reference its host, category, group if applicable, location, attendees, and reviews.

Store event coordinates as latitude and longitude.

Maintain consistent relationships between events, users, registrations, and groups.

Use reusable services for:

- Event creation.
- Event filtering.
- Event registration.
- Recommendations.
- Review calculations.

- TNadem Miles.
- Map data.
- Chat persistence.

Do not scatter localStorage operations throughout UI components.

---

21. Seed Data and Calgary Realism

Create enough realistic demo content to make the platform feel alive.

Seed:

- 25–35 Calgary events.
- 8–12 community groups.
- Several demo user profiles.
- Multiple event categories.
- Events across all four quadrants.
- Free and paid events.
- Different accessibility features.
- Different group sizes.
- Several traveller-friendly activities.
- Some past events with demo reviews.
- Some upcoming events with available spaces.

Examples:

Bow River Sunrise Run

- Running.
- Prince's Island Park.
- Free.
- Beginner-friendly.
- Small-to-medium group.

Kensington Weekend Book Club

- Reading.
- Kensington.
- Free.
- Small group.
- Quiet environment.

YYC Film Discussion Night

- Movies.
- Central Calgary.
- Low cost.
- Beginner-friendly.

Nose Hill Photography Walk

- Photography.
- Nose Hill Park.
- Free.
- Outdoor activity.

Calgary Student Tech Meetup

- Technology.
- University of Calgary.
- Free.
- Beginner-friendly.

Fish Creek Weekend Hiking Group

- Hiking.
- Fish Creek Provincial Park.
- Free.
- Outdoor activity.

Use believable future dates relative to the demo date.

Ensure event locations, map markers, filters, and details remain consistent.

Clearly label seeded events as demonstration events.

---

22. Recommendation Engine

Implement a lightweight personalized recommendation system.

No paid AI API is required.

Suggested scoring:

- Interest match: 35%.

- Date and availability match: 20%.
- Location preference: 15%.
- Accessibility preference match: 15%.
- Budget match: 10%.
- Beginner-friendly preference: 5%.

Hard constraints, such as event dates, maximum budget when explicitly required, event capacity, and essential accessibility needs, should be applied before ranking.

Do not recommend full or expired events as joinable.

Display a short explanation:

"Recommended because you enjoy running and prefer free, beginner-friendly activities."

This makes recommendations transparent and understandable.

---

23. Impact Measurement

Judges should immediately understand how TNadem improves Calgary community participation.

Create a small community impact section or dashboard.

Track demonstrable metrics such as:

- Event registrations.
- Completed events.
- Community groups formed.
- Free activities available.
- Accessibility-labelled events.
- Traveller participation.
- Unique interest categories represented.

For the hackathon, label seeded numbers as demo data.

Do not present invented metrics as real Calgary impact.

Explain how a production deployment could measure whether users are actually forming meaningful connections.

For example, an optional post-event question:

"Would you attend another activity with this group?"

Aggregate responses at the event or community level, without publicly rating individuals.

---

24. Privacy, Trust, and Responsible Design

Privacy should be a product advantage.

Implement:

- Optional public profile information.
- No public home addresses.
- No required health disclosures.
- Clear consent for optional personal details.
- Ability to edit or delete local demo data.
- No public individual ratings.
- Basic reporting controls.
- Transparent simulated verification.
- Clear demo-data labels.
- Privacy-aware event location display.

For private or residential event locations, show an approximate area publicly rather than a precise address.

Use clear language explaining what information is visible to other users.

Do not claim the demo is production-secure.

---

25. Technical Execution Standards

The application must be genuinely functional.

Prioritize:

- Clean component architecture.
- Strong TypeScript types.
- Reusable UI components.
- Consistent state management.
- Reliable persistence.
- Working navigation.
- Form validation.

- Responsive design.
- Accessibility.
- Error handling.
- Realistic seed data.
- Logical relationships between features.

Test important workflows.

At minimum, verify:

1. User can complete onboarding.
2. Interests affect event recommendations.
3. Event filters update correctly.
4. Price slider works.
5. Map markers correspond to events.
6. Clicking a marker opens correct event details.
7. User can create an event.
8. Created event appears on the map.
9. User can join an event.
10. Event capacity updates.
11. Joined event appears in dashboard.
12. Event group chat works.
13. Messages persist after refresh.
14. User can leave an event.
15. Participation milestones update correctly.
16. Eligible attendees can review completed events.
17. Leaderboard updates based on event reviews.
18. Accessibility filters work.
19. Traveller date filters work.
20. Application works on mobile.

Avoid buttons that look functional but do nothing.

---

26. Hackathon Development Priorities

Build in this order.

Priority 1: Must Work

- Branding and responsive layout.
- Landing page.

- Demo onboarding.
- Event discovery.
- Functional filters.
- Event detail pages.
- Event creation.
- Event joining.
- localStorage persistence.
- Interactive Calgary map.

Priority 2: Strong Differentiators

- Accessibility preferences.
- Ease Into It.
- Traveller-to-local discovery.
- Event group chat.
- Community groups.
- TNadem Miles.
- Personalized recommendations.

Priority 3: Extra Polish

- Event ratings.
- Calgary event leaderboard.
- Participation milestones.
- Detailed profile customization.
- Community impact dashboard.
- Advanced animations.
- Optional shared backend.

Complete and test each priority before moving to the next.

A smaller working product is better than a larger broken product.

---

27. Judge Demonstration Experience

Design the application so we can deliver a compelling 3–5 minute live demonstration.

The demo should tell a coherent story.

Scene 1: The Problem

A student has just moved to Calgary.

They want to meet people but do not know where to start.

Scene 2: Personalized Onboarding

They register and select:

- Running.
- Reading.
- Hiking.
- Free events.
- Small groups.
- Beginner-friendly activities.

Scene 3: Smart Discovery

TNadem recommends relevant Calgary activities.

Show the price slider and accessibility filters working.

Scene 4: Interactive Calgary Map

Open the map.

Show event markers across Calgary.

Filter to NW Calgary.

Click an event marker and display event details.

Scene 5: Real-World Participation

Join a running event.

Show the registration count update.

Open the event group chat.

Show the event in the user's dashboard.

Scene 6: Community Creation

Create a new book club event.

Show that it immediately appears in discovery and on the Calgary map.

Scene 7: Accessibility

Enable Ease Into It.

Demonstrate how recommendations change to prioritize smaller, welcoming, beginner-friendly events.

Scene 8: Traveller Experience

Switch to a visitor profile.

Enter travel dates.

Show relevant local activities.

Scene 9: Community Impact

Show TNadem Miles and the community impact dashboard.

Conclude with:

"TNadem doesn't measure how many people follow you. It helps you find people to go somewhere with."

Make this demonstration flow easy to reproduce using seeded data and demo accounts.

---

28. What Makes TNadem Different?

The application should clearly communicate five differentiators.

1. Group-First, Not Profile-First

The platform rewards shared participation rather than individual popularity.

2. Calgary-Native Discovery

Events are organized around Calgary's actual geography, neighbourhoods, and four quadrants.

3. Accessible Community Participation

Comfort & Access and Ease Into It help users discover activities suited to their preferences.

4. Traveller-to-Local Experiences

Visitors can participate in authentic local community activities rather than relying exclusively on commercial tourism services.

5. Participation Without Personal Judgment

TNadem Miles celebrate engagement, while reviews evaluate events rather than individuals.

These differentiators must be visible in the actual product, not merely described in marketing text.

---

29. Deliverables

Produce:

1. A complete working React and TypeScript web application.
2. A coherent, maintainable project structure.
3. A responsive Calgary-inspired design.
4. A distinctive tandem bicycle logo with two smiley-faced riders.
5. Real functional event filtering.
6. An interactive Calgary map.
7. Working event creation and registration.
8. Persistent demo data.
9. A functional event group chat.
10. Accessible event discovery.
11. Traveller-to-local discovery.
12. A clear README explaining setup and architecture.
13. Instructions for running the application locally.
14. A short explanation of the recommendation and leaderboard algorithms.
15. A list of demo limitations and production improvements.

The application should run using standard commands such as:

```
None
npm install
npm run dev
```

Do not require paid API keys.

Do not leave essential functionality as pseudocode.

---

30. Final Instructions

Build the product, not just a plan.

Start by briefly establishing the architecture and component structure, then proceed directly into implementation.

Make reasonable technical and design decisions independently.

Do not repeatedly ask for confirmation on minor details.

If a feature is too complex for the available time, implement a functional simplified version and clearly document the limitation.

Prioritize actual working functionality, excellent design, and an impressive demo.

Do not use placeholder buttons, broken links, nonfunctional filters, or fake integrations.

Treat this as a serious startup-quality prototype being presented to judges who care about innovation, community impact, feasibility, technical quality, and accessibility.

The result should feel polished enough that someone could imagine TNadem becoming a real Calgary community platform.

Our mission: Make Calgary feel smaller, more welcoming, and more connected, one shared experience at a time.
